In case syrups from the centrifugals are to be drawn into the pan, which does not impair the quality of the raw sugar, as is often represented, they must be diluted with waste water or thin juice, submitted to mechanical filtration, if necessary, with addition of a small quantity of lime cake, and drawn into the pan about the end of the boiling. By the dilution the viscosity is completely destroyed, as the viscosity is due to nothing else but over-saturation of the solution with sugar. Furthermore, by the dilution the energy of crystallization is greatly increased, the sugar gains the molecular mobility necessary for overcoming the resistance to crystallization, while at the same time an easier displacement of the non-sugar and coloring substance is attained. In this way...
